

The Spell Checker for ASP.Net Web Applications

Getting Started with ASPNetSpell

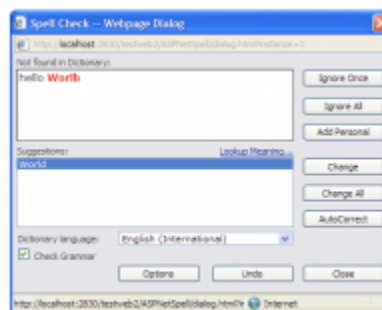

The AspNetSpell component provides international spell checking for your ASP.Net web forms. It can be installed and integrated into most applications in a few minutes.

AspNetSpell behaves very similarly to MS Word's own spellchecker, making this software familiar to users. In addition ASPNetSpell users have access to a library of free [international dictionaries](#).

AspNetSpell is compatible with ASP.Net 1, 2, 3, 3.5 and 4. The code it delivers is W3C HTML and XHTML compliant, and has a good degree of accessibility.

This guide covers basic usage in an ASP.Net Web Application:

- For MVC Installation and usage - please read the [ASPNetSpell MVC installation and hello-world tutorial](#)
- For use with the new Razor framework - please read the [ASPNetSpell Razor installation and hello-world tutorial](#)

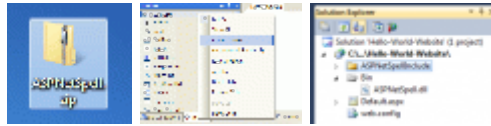

Quickstart Guide

1. [Download](#) and unzip AspNetSpell to a convenient location on your hard disk.
2. Add the ASPNetSpell.dll to your Visual Studio toolbox ([help...](#)). You can do this easily

by just double clicking on the Install.vscontent file

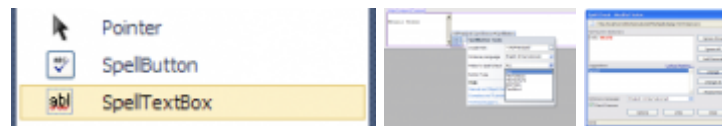

3. Copy the directory called *AspNetSpellInclude* to the root folder of your website project. The easiest way to do that is to simply drag it the folder into your Solution Explorer. ([help](#))

Using AspNetSpell.SpellButton for the First Time

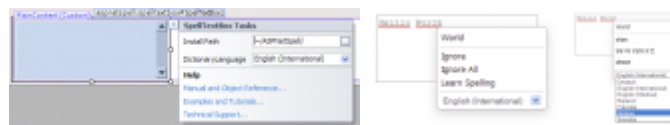

Drag the SpellButton control from the toolbox onto your ASPX web form in design mode. You will see that it renders as a spell check button ([if not read this](#)).

To select the field(s) that AspNetSpell will spell check, change the [FieldsToSpellCheck](#) property.

Using AspNetSpell.SpellTextBox for the First Time

Drag the SpellTextBox into the web form in place of any normal multi-line text box.
